Assignment 2 – Changes

By Thomas Frew – a1850112

My feedback for Assignment 2 was

"Great job on implementing your own JSON parser. It's evident that a considerable amount of effort has gone into testing, which is commendable. Moving forward, please ensure that you also include a detailed design sketch as part of your submission."

First of all, thank you! I've put hours of time into architecting tests with complete softwar coerage, and I am happy that is has not gone unnoticed.

Since the only piece of feedback I received was "including a detailed design sketch", I created a "Final Design" PDF that has a detailed explanation of the original design, and the final design I went with. I hope you find this helpful in executing and understanding the project.

I added support for canonical hostnames (aggregationServer ma,es with http:// are now valid).

I also added some more GETClient, ContentServer and JsonParser tests, and made existing integration tests more lenient to people with slow port interactionss.
